

From one task to a self-running system

Automations, plugins and dynamic workflows

Today

Core: what Devin can run for you. Extras: what is new around it.

CORE · LIVE

Devin runs the work

Devin suggests the automations

Automations on Azure DevOps

Plugins

Dynamic workflows

EXTRAS · IF TIME

Around it

| CLI ⇌ Cloud

| Code scans

| Devin On-Call · beta

| Devin Migrations · beta

THE THREAD

One demo service, start to finish. Every step ends in a PR and an updated board.

Devin suggests the automations

You do not have to know what to automate. Devin looks at how your team already uses it.

HOW IT WORKS

Three clicks

Automations → Create → “Suggest for me”

Devin reviews recent sessions and integrations

Proposals arrive with trigger and prompt filled in

WHY IT MATTERS

Start from evidence

- | Suggestions come from your real repetition, not a template.
- | Edit, add limits, save disabled. Enable when you have watched it once.
- | “Generate with Devin” builds anything the list misses.

NEXT

We take one suggestion and turn it on.

Automations on Azure DevOps

Your board assigns work to Devin like any other team member.

THE LOOP

Work item → PR

Work item assigned to Devin

Service hook fires, conditions match

Session implements and verifies

PR opens, work item updated to Resolved

GUARDRAILS

Safe to leave on

- | Conditions on the payload: only the right items start a session.
- | Limits: ACUs per run, runs per hour, concurrency and queueing.
- | Human gates: Devin asks in Teams when unsure. It never closes items.
- | Same pattern for failing CI, scheduled chores and incident alerts.

THE RULE

Nothing goes on a trigger you have not watched succeed by hand.

Plugins

Everything you taught Devin about a codebase, as one versioned, installable unit.

BEFORE

Three loose pieces

- | Knowledge notes: flat text, hard to scope.
- | Playbooks: reusable prompts, no tools or rules.
- | Skills: per repo, each one reinventing the house rules.

NOW

One plugin

- | Rules + skills + hooks + MCP connections together.
- | Installed per person, org or enterprise. Required or optional.
- | Your Knowledge is already migrated into a plugin.
- | Devin can edit and roll out the plugin itself.

DEMO

Ask Devin to add a rule; watch it update the plugin and ask for approval.

Dynamic workflows

Many similar tasks, one prompt. Devin orchestrates a fleet of sessions with code.

THE SHAPE

Fan out, verify, roll up

Inventory the work

One agent per item, in parallel

A different agent verifies each result

Roll up into one PR

WHAT SURPRISES PEOPLE

Control while it runs

- | Interrupt one agent mid-flight; the others never notice.
- | Stop the run, resume by id. Finished work is not redone.
- | Structured output between steps, so the script decides what happens next.

WHEN

Five or more items and more than one step. Below that, an automation is enough.

Extra: CLI ⇄ Cloud

The same Devin on your laptop and in the cloud. Work moves, context comes with it.

ROUND TRIP

One task, two places

Start locally in the terminal

/handoff sends it to the cloud

devin ssh and devin forward reach the cloud VM

/pickup brings it back to the laptop

WHY IT MATTERS

No more choosing a machine

- | Long tasks no longer die when the lid closes.
- | Debug inside the cloud VM as if it were local.
- | Hands off from Claude Code and Cursor too.

DEMO

Start a ticket locally, hand off, ssh in, pick it back up.

Extra: code scans

Whole-codebase scans with findings Devin can fix.

HOW IT WORKS

Scan → findings → fix

Pick a scan type or write your own brief

Findings tab: severity, file, explanation

Assign to Devin, one or in bulk

Fix PRs come back reviewed

WHY IT MATTERS

A queue, not an audit

- | Security, performance, dead code, test coverage, accessibility.
- | Scheduled, across many repos, only on new commits.
- | Security Swarm adds threat models and chained attack paths.

DEMO

Scan the demo service, read three findings, assign one to Devin.

Extra: Devin On-Call

BETA · EARLY ACCESS

Devin as the first responder. No prompt engineering required.

THE FLOW

Alert → fix → post-mortem

Incident fires in PagerDuty or the on-call chat

Devin triages and posts incident notes

Fix PR opens; the human on call is pinged

On resolve, the post-mortem is drafted

WHY IT MATTERS

Faster than opening a laptop

- | Reproduces, reads logs and recent PRs before anyone is awake.
- | Never merges, never closes the incident.
- | You are seeing this before general availability.

DEMO

Fire a test alert against the demo service and watch the notes appear.

Extra: Devin Migrations

[BETA · EARLY ACCESS](#)

The dynamic workflow as a product: inventory, plan, parallel execution, roll-up.

THE FLOW

A managed run

Point it at a codebase and a target

Review the inventory and plan

Units run in parallel with verification

Roll-up: merged, needs a human, ready for review

WHY IT MATTERS

Supervise, do not script

- | Frameworks, language versions, patterns, legacy jobs.
- | Progress and cost visible while it runs.
- | Beta today; flow shown from the beta UI.

DEMO

Same legacy jobs as the workflow demo, this time with no script.

Take it home

Three things to switch on this week.

THIS WEEK

Start small

Run “Suggest for me” on your org

Turn one repo’s knowledge into a plugin

Find your first fan-out

THE MEASURE

What good looks like

- | Fewer human hours per ticket, not more sessions.
- | Automations you can leave on because of limits and gates.
- | One place that holds what Devin knows about your code.

THANK YOU

Questions.

Automation Triggers

Input Sources

- | **Custom webhooks.** Any external system that POSTs an event.
- | **Schedules.** Daily, weekly, or custom intervals (replaces current scheduled-sessions flow).
- | **Github Events.** PR opened, issue activity, or CI results.
- | **Slack Events.** Message posted in a channel or alert firing.
- | **Linear Events.** Tickets opened, state changes, etc.

Autonomous Execution Loop

Event-Driven Use Cases with Devin Automations

Vulnerability Remediation

Automatically scan every PR for security risks.
Have Devin scope + apply patches safely.

Incident Management

Automate RCA and reduce MTTR by paging
Devin instead of your teammates.

Code Review

Automatically scan every PR for security risks.
Have Devin scope + apply patches safely.

Unit Test Coverage

Check every PR for new, untested code. Have
Devin automatically write + apply new tests.

Project Management

Assign a ticket to Devin for automatic scoping,
planning, and execution.

Communication Channels

Just @Devin on Slack to assign a task. Have
team members in-channel for visibility.
